

SAMPLE WEBSITE TESTING USING FUNCTIONS IN SELENIUM IDE

With a website selected and Selenium IDE opened, you can click on the “Command” Line, then the arrow at the end of the command line and you will see ALL of the Selenium IDE commands that are available for use. This language is often called “Selenease”. This example demonstrates the use of `VerifyText` and `verifyElementPresent`. The names of the image and the value of the test MUST MATCH EXACTLY what is included in the HTML code. You may need to click on the webpage and then click on “View Page Source” to see EXACTLY what the web page objects were named.

Once you have a command selected, click on the “Select” button, then click on the object on the web page that you want to verify and the link will automatically be added to the Target field, then enter the text value in the “Value” field.
